Ballscrews

Ballscrews consist of a shaft, a nut into which the balls are integrated and the ball recirculation system. Ballscrews are the type of threaded shaft most commonly used in industrial and precision machines. They are used to convert rotary motion into longitudinal motion and vice versa. They display great accuracy and are highly efficient. HIWIN provides a large selection of ballscrews suitable for all your applications.

HIWIN ballscrews are distinguished by their low-friction and precise running, require little drive torque and offer good rigidity with smooth operation. HIWIN ballscrews are available in rolled, peeled and ground versions making them the optimum product for any application.

Ballscrews

Contents

Contents

1. Product overview

Rolled ballscrews

- Flange nuts and cylindrical nuts
- Reduced axial play available
- Nominal diameter 8 – 63 mm
- Standardised end machining

Peeled ballscrews

- Flange nuts and cylindrical nuts
- Single and double nuts
- Nominal diameter 16 – 80 mm
- Standardised end machining

Ground ballscrews

- Flange nuts and cylindrical nuts
- Single and double nuts
- Nominal diameter 6 – 100 mm
- Preloaded or minimum axial play

Ballscrews for special requirements

- Driven nut unit
- Ballscrews for heavy-duty operation
- Safety nuts

Shaft ends and accessories

- Standard end machining
- Standard spindle bearings
- Nut housing

2. General information

2.1 Properties

There are many benefits associated with HIWIN ballscrews including high efficiency, freedom from axial play, high rigidity and high lead accuracy. The characteristic properties and benefits of HIWIN ballscrews are described in detail below.

2.1.1 High efficiency in both directions

Thanks to the rolling contact between the shaft and nut, ballscrews can achieve an efficiency of up to 90 %.

The special surface treatment used on the ball tracks in HIWIN ballscrews reduces the frictional resistance between the ball and track.

The rolling motion of the balls only requires a low drive torque thanks to the high level of efficiency. Operating costs are therefore cut since less drive output is needed.
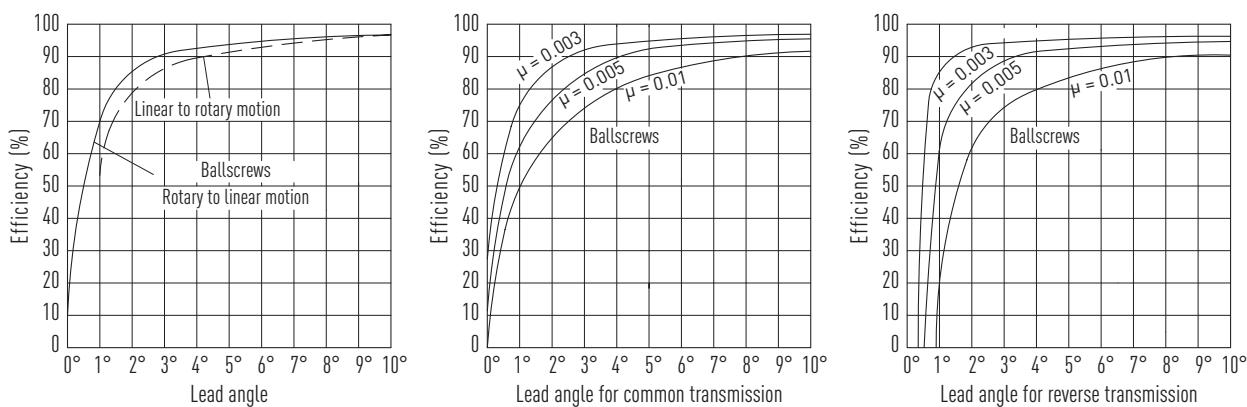

Fig. 2.1 **Mechanical efficiency of threaded shafts**

2.1.2 Zero play and high rigidity

The pointed profile HIWIN uses for ballscrew shafts and nuts allows the ballscrew nuts to be assembled without any axial play. A preload is usually used to achieve the good overall rigidity and repeatability.

Semi circular profile   Pointed profile (Gothic type)
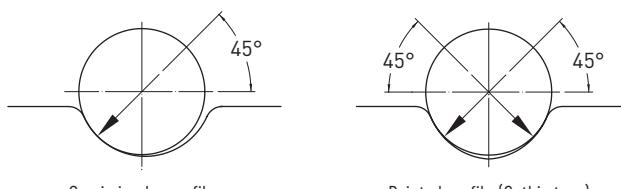

Fig. 2.2 **Typical types of contact in ballscrews (semi circular type, Gothic type)**

2.1.3 High lead accuracy

For applications requiring very high levels of accuracy, our production meets the requirements of ISO and JIS standards; but we manufacture to customer specifications too.

Accuracy is guaranteed by testing with our laser measurement systems and documented for the customer.

2.1.4 Reliable service life

Whereas the life of standard screw drives is determined by wear on the contact surfaces, HIWIN ballscrews can be used virtually up until the end of the metal's fatigue life. Great care is exercised in development, choice of material, heat treatment and manufacturing, as is demonstrated by the reliability and resilience of HIWIN ballscrews over their nominal service life. With every kind of ballscrew, the service life depends on several influencing factors including design aspects, material quality, maintenance and most importantly the dynamic load rating (C_{dyn}).
Profile accuracy, material properties and surface hardness are the fundamental factors affecting the dynamic load rating.

2.1.5 Low starting torque with smooth operation

The rolling friction of the balls in ballscrews only requires a very low starting torque. To achieve precise ball tracks, HIWIN uses a special design (adaptation factor) and special production procedures. This guarantees that the motor's drive torque remains in the range required.

In one particular step of manufacturing, HIWIN can check the profile of every single ball track. A sample report of this test is shown in Fig. 2.3.

Using computer-based measuring systems, the friction torque of every ballscrew is recorded and documented with great accuracy at HIWIN. Fig. 2.4 shows typical torque progress over travel.

2.1.6 Special solutions

HIWIN manufactures ballscrews in line with customer drawings or with HIWIN standard end machining. For the ballscrew definition the requirements on the project planning sheet must be documented and checked. This ensures that the ballscrew is ideally adapted to the requirements in place.

Ballscrews

Properties and selection

3. Structural properties and selection of HIWIN ballscrews

3.1 Design information

a) Select a suitable ballscrew for your application (see Table 3.5). The relevant requirements must be noted for installation. For precision-ground ballscrews with CNC machines, this means careful alignment and the corresponding type of installation; for applications requiring less precision, we recommend rolled ballscrews, which require less work when designing the type of installation and bearings.

Radial load   Moment load
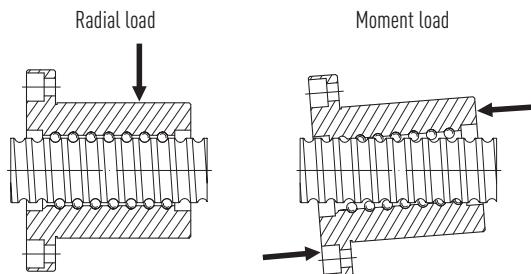

Fig. 3.1 **Uneven load distribution,** caused by insufficient alignment of support bearing and ballscrew nut, incorrect configuration of mounting surface, incorrect angle or error in aligning the nut flange

b) It is particularly important that the bearing housing and ballscrew nut are assembled axially parallel; otherwise uneven load distribution would result. Radial and torque loads are also among the factors which result in uneven load distribution (see Fig. 3.1). This can cause functional limitations and shorten the service life (see Fig. 3.2).

Ball nut – FSWXB2
Specifications:
    Shaft diameter: 40 mm
    Lead: 10 mm
    Ball diameter: 6.35 mm
    Radiales play: 0.05 mm
Conditions:
    Axial force Fa: 3000 N
    Radial displacement: 0 mm

Service life ratio $= \dfrac{Lr \ (\text{realservice life})}{Ld \ (\text{desired service life})}$

Assembly inclination (10^{-4} rad)
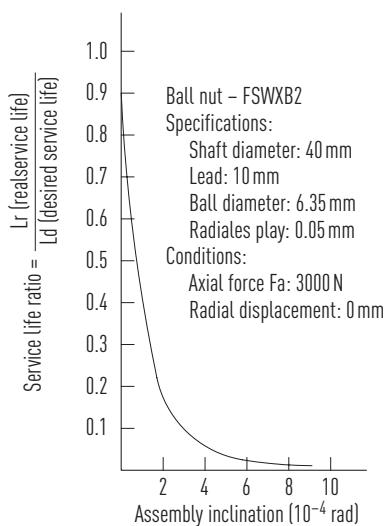

Fig. 3.2 **Impacts on life expectancy** of radial load caused by insufficient alignment

c) Select the right type of bearing for the ballscrew shaft. When used in CNC machines, we recommend angular ball bearings (angle = 60°) because of their higher axial load capacity and the fact that they permit zero-backlash or pre-loaded installation.
A selection of possible end machining processes and suitable floating and fixed bearings are listed in Chapter 8 onwards.

d) Precautionary measures must be taken to stop the ballscrew nut once the useful path has been exceeded (see Fig. 3.3). Travel against an axial fixed stop results in damage.
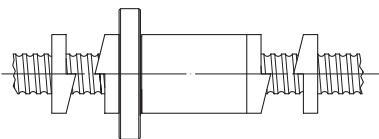

Fig. 3.3 **Mechanical stop which prevents the travel distance from being exceeded**

e) In environments with high levels of dust or metal debris, ballscrews should be provided with a telescopic or bellows shaft protection (see Fig. 3.4).
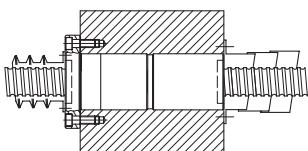

Fig. 3.4 **Telescopic or bellows shaft protection**

f) When using an internal or end cap ball recirculation system, the ball thread must be cut to the end of the shaft. The diameter of the adjacent bearing journal must be around 0.5 –1.0 mm less than the core diameter of the ball tracks (see Fig. 3.5).
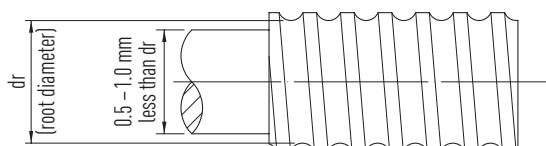

Fig. 3.5 **Special requirement of bearing journal with internal recirculation system**

g) While surface-hardening the shafts, 2 to 3 thread turns are left unhardened on the two ends adjacent to the bearings so that connection modifications are possible. These areas are marked with the symbol in HIWIN drawings (see Fig. 3.6). Please contact HIWIN if you have special requirements for these areas.
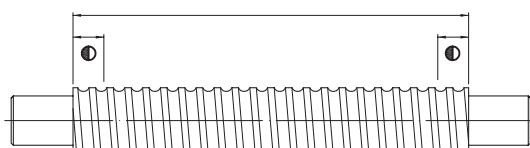

Fig. 3.6 **Area of surface hardening on a ballscrew shaft**

h) Excess preload results in increased friction torque which in turn causes heating and therefore a reduced service life. On the other hand, insufficient preload reduces rigidity and increases the risk of backlash. For details, see Sections 3.6 and 3.7.7.

Ballscrews

Properties and selection

3.2 Procedure for selecting a ballscrew

Table 3.1 shows the procedure for selecting a ballscrew. The usage requirements
(A) can be used to determine the necessary ballscrew parameters (B). The ballscrew
suited to the application can therefore be determined one step at a time following the
information provided (C).

Table 3.1 **Procedure for selecting a ballscrew**

Step	Usage requirement (A)		Ballscrew parameter (B)	Reference (C)
1	Positioning accuracy		Lead accuracy	Table 4.1, Table 5.1, Table 6.1
2	Speed		Lead of screw drive	$p = \dfrac{v_{max}}{n_{max}}$
3	Total length of travel distance		Total length of thread	Total length = thread length + length of end machining Thread length = travel distance + length of nut + distance which cannot be used due to connection design (e.g. nut housing, bearing housing etc.)
4	1 2	Load conditions [%] Speed conditions [%] ($\leq 1/5$ C recommended)	Average axial load Average speed	Formulas F 3.4 – F 3.9
5	Average axial force		Preload	Formula F 3.5
6	1 2 3	Nominal service life Average axial load Average speed	Dynamic load rating	Section 3.7.2, "Service life"
7	1 2 3 4	Dynamic load rating Lead of ballscrew Critical speed Speed limitation by D_N value	Shaft diameter and nut type	Section 3.7.2, "Service life"
8	1 2 3 4	Diameter of ballscrew Nut type Preload Dynamic load rating	Rigidity	Section 3.7.7, "Rigidity"
9	1 2	Ambient temperature Length of ballscrew	Thermal deformation and final value of cumulative lead (T)	Section 3.7.8, "Thermal expansion"
10	1 2	Shaft rigidity Thermal deformation	Preload	Section 3.7.8, "Thermal expansion"
11	1 2 3	Max. table speed Max. start-up time Configuration of ballscrew	Motor drive torque and configuration of motor	Section 3.7.3, "Drive torque and drive output of motor"

3.3 Ballscrew shafts

HIWIN offers rolled, peeled and ground ballscrews – depending on the application requirements. For the selection of the appropriate shaft the individual characteristics are listed in Table 3.2.

Table 3.2 **Procedure for the selection of a ballscrew**			
	Rolled	**Pealed**	**Ground**
Profile			
Manufacturing process	Forming process	Cutting process	Grinding process

Max. shaft length[1] [mm]	500 – 5,600	3,300 – 6,500	110 – 10,000
Nut shapes	Flange nut Cylindrical nut	Flange nut Cylindrical nut Double nut	Flange nut Cylindrical nut Double nut
Availability	From stock	From stock	Upon request

[1] Depends on the diameter and the tolerance class

3.4 Ball recirculation systems

HIWIN ballscrews are available with three different recirculation systems.

The external recirculation system consists of the return tubes and the clamping plate. The balls are placed in the ball track between the ballscrew shaft and nut. At the end of the nut, they are guided out of the ball track and back to the start via a return tube; ball circulation is therefore a closed circuit (see Fig. 3.7).
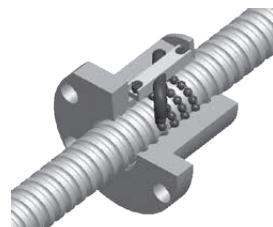

Fig. 3.7 **External recirculation type nut**

In the case of the internal single recirculation, the balls are each fed back to the beginning of a thread turn with the help of the deflecting parts. The balls undertake just one circuit around the shaft. The circuit is closed by a deflecting part in the ballscrew nut and allows the balls to return to the start via the rear of the thread. The position of the ball deflection in the nut gives the internal single recirculation system its name (see Fig. 3.8).
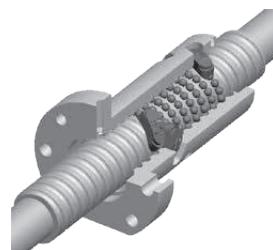

Fig. 3.8 **Internal single recirculation type nut**

The third type of return is the endcap recirculation system shown in Fig. 3.9. It has the same basic principle as the external return, however, the balls are returned via a channel in the ballscrew nut. The balls perform one complete cycle in the ballscrew nut. The endcap return is also called "internal total recirculation".
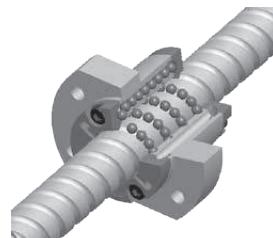

Fig. 3.9 **Endcap recirculation type nut**

3.5 Accuracy of the HIWIN ballscrews

3.5.1 Tolerance class

HIWIN ballscrews are produced in various tolerance classes depending on the application's accuracy requirements.

Fig. 3.10 **HIWIN measurement curve of lead of precision ballscrews**
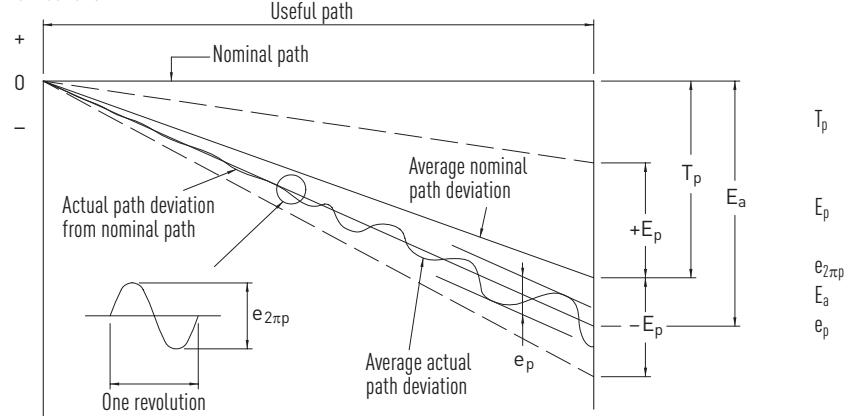

T_p	Difference between nominal and actual path. This value is determined by the various requirements of the customer's application.
E_p	Maximum actual path deviation from nominal path over complete distance.
$e_{2\pi p}$	Path deviation within one revolution
E_a	Actual path, determined using laser measurement
e_p	Actual path deviation. Maximum deviation of total actual path from actual total nominal path in the corresponding area

Fig. 3.11 **DIN ISO measurement curve of lead of ballscrews**

e_{300p}	Actual path deviation at 300 mm. Actual path deviation over 300 mm at any thread position
e_{0a} (E_a)	Average actual path deviation over useful path l_0
C (T_p)	Path compensation over useful path l_0
e_p (E_p)	Limit deviation of nominal path
v_{up} (e_p)	Permissible path deviation over useful path l_0
v_{300p} (e_{300p})	Permissible path deviation over 300 mm
$v_{2\pi p}$ ($e_{2\pi p}$)	Permissible path deviation over one revolution

3.5.2 Travel fluctuation over 300 mm travel distance

As an international company, HIWIN produces ballscrews on the basis of DIN ISO 3408 in tolerance classes 0, 1, 3, 5, 7 and 10 and in accordance with the Japanese standard JIS in classes 0, 2 and 4. The tolerance classes as well as the permissible travel fluctuation v_{300p} over 300 mm path are listed in Table 3.3.

Table 3.3 **International standards for tolerance classes of ballscrews**

3.6 Preload and play

The axial force F_a, caused by outer drive forces or inner preload forces, produces two kinds of axial play. Firstly, axial play S_a, that originates from the air between the ball and ball track. Secondly, the spring compression play $\Delta\ell$, caused by the force F_n, which acts vertically on the point of contact.

By default, rolled and peeled ballscrews are delivered with slight play. This is sufficient for most applications, and has the advantage that the ballscrews run smoothly and a low starting torque is required.

If increased demands are placed on the positioning accuracy and rigidity, the ballscrew should be used with no axial play or preloaded. For preloading, different methods are available, which are explained below.
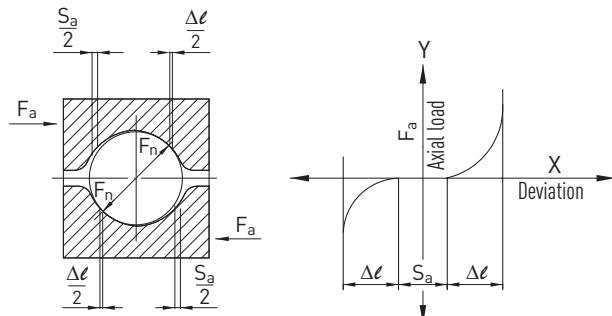

Fig. 3.15 **Gothic arch profile and preload**

3.6.1 HIWIN types of preload

Preload can be generated either with double nuts, or single nuts with lead offset or in the case of preloaded single nuts by adjusting the ball size.

Preloaded single nuts

There are two kinds of preload for the single nuts. One of these is the ̈preload method with oversized balls ̈. This involves balls which are slightly larger than the space in the ball tracks between spindle and nut; the ball therefore makes contact at four points (see Fig. 3.16).
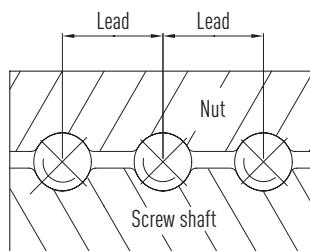

Fig. 3.16 **Preload from ball size**

The other method is known as ̈preload from lead offset ̈ (see Fig. 3.17). The nut is ground such that it is offset from the central lead. This type of preload takes the place of the classic double nut preload and offers the benefit that a compact single nut with good rigidity can be used with low preload forces. This method is not, however, suited to use with high preloads and high leads. The recommend preload force is less than 5 % of the dynamic load rating (C).
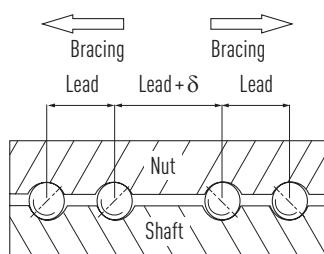

Fig. 3.17 **Preload from lead offset**

Preloaded double nuts

The preload is generated by inserting a spacer between the nuts (see Fig. 3.18). The O preload results from fitting an oversized spacer which pushes the halves of the nut apart. The X preload is generated with an undersized spacer which pulls the nuts together.
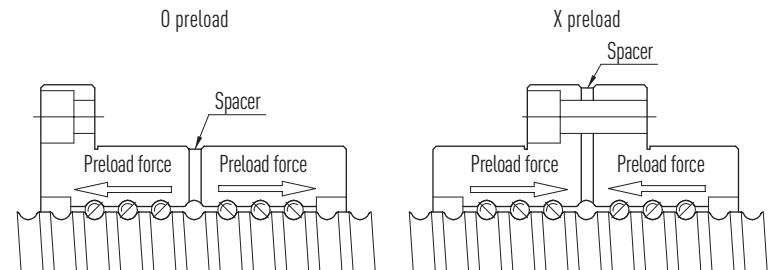

O preload | X preload

Fig. 3.18 **Preload from spacer**

3.6.2 Effects of preload

Preload increases the thread's friction torque and therefore causes increases in temperature during operation. To ensure a long service life and low increase in temperature, the maximum preload should not exceed 5 % of the dynamic load rating for single nuts and 10 % for double nuts.

Furthermore preload has an effect on the running characteristics. Besides an increase in idle torque it leads to fluctuations in idle torque, especially with ballscrews with high tolerance classes. (see Section 3.6.3).

Basically, ballscrews should only be preloaded when it is absolutely necessary to avoid axial play.

3.6.3 Idle torque fluctuation

(1) Measuring method

Preload produces a friction torque between nut and threaded shaft. This is measured by moving the threaded shaft at constant speed while holding the nut with a special locking device (see Fig. 3.19).

The force F_{Pr} measured by the force sensor is used to calculate the idle torque of the threaded shaft.

F 3.2

$$T_d = \frac{K_p \times F_{pr} \times P}{2000 \times \pi}$$

T_d Idle torque of preloaded nut
F_{Pr} Preload force
P Lead
K_P Preload friction coefficient

K_P $= \dfrac{1}{\eta_1} - \eta_2$ (between 0.1 and 0.3)

η_1, η_2 are the mechanical efficiencies of the ballscrew

(2) Measurement conditions
    1. Without wiper
    2. Speed: 100 rpm
    3. Dynamic viscosity of lubricant 61.2 – 74.8 cSt [mm/s] at 40 °C, complying with ISO VG 68 or JIS K2001

(3) The result of the measurement is displayed using standard depiction of idle torque; the nomenclature is shown in Fig. 3.19.

(4) Fluctuations in idle torque (incorporated in the tolerance class definition) are listed in Table 3.16.

(a) Idle torque
(b) Fluctuations in idle torque
(c) Friction torque currently measured
(d) Average measured friction torque
(e) Measured starting torque

Ballscrews

3.7 Calculations

Bases of calculations in accordance with DIN ISO 3408.

3.7.1 Load ratings

Dynamic load rating C_{dyn} (theoretical)

The dynamic load rating describes the load at which 90 % of all ballscrews reach a life expectancy of 1×10^6 revolutions (C). The reliability factor can be taken into account in accordance with Table 3.17. The dynamic load rating is listed in the dimensions tables for the nuts.

Static load rating C_0

The static load rating describes the load which causes permanent deformation of the ball track of more than 0.0001 of the ball diameter. In order to calculate the maximum static load rating, the static structural safety S_0 of the application conditions must be taken into account.

F 3.3

$$S_0 \times F_{amax} < C_0$$

S_0 Static structural safety
C_0 Static load rating (dimensions table for nut)
F_{amax} Max. static axial load

3.7.2 Service life

a) Average speed n_m

F 3.4

$$n_m = n_1 \times \frac{t_1}{100} + n_2 \times \frac{t_2}{100} + n_3 \times \frac{t_3}{100} + \dots$$

n_m Average speed, total [rpm]
n_n Average speed in phase n [rpm]
t_n Amount of time in phase n [%]

b) Preload

F 3.5

$$F_{pr} = \frac{f_{pr}}{100\,\%} \times C_{dyn}$$

F_{pr} Preload force
C_{dyn} Dynamic load rating
f_{pr} Preload factor in %
      Single nut $f_{pr} \leq 5\,\%$
      Double nut $f_{pr} \leq 10\,\%$
F_{lim} Disengagement force

F 3.6

$$F_{lim} = 2^{3/2} \times F_{pr}$$

Distinction of cases:

$F_n > F_{lim}$ No influence from preload: $F_{bn} = F_n$
$F_n < F_{lim}$ Influence from preload: Formula F 3.7

F 3.7

$$F_{bn} = \left(1 + \frac{F_n}{2^{3/2} \times F_{pr}}\right)^{3/2} \times F_{pr}$$

F_n Axial loading in phase n
F_{bn} Operating axial loading in phase n

F_n must be calculated for all phases and used in Formula F 3.7.

c) Average operating load F_{bm}

o   With alternating load and constant speed

F 3.8

$$F_{bm} = \sqrt[3]{F_{b1}{}^3 \times \frac{t_1}{100} \times f_{p1}{}^3 + F_{b2}{}^3 \times \frac{t_2}{100} \times f_{p2}{}^3 + F_{b3}{}^3 \times \frac{t_3}{100} \times f_{p3}{}^3 \dots}$$

F_{bm}	Average operating load [N]
F_{bn}	Operating axial loading in phase n
f_p	Operating condition factor
f_p	1.1 – 1.2 operation without impact
	1.3 – 1.8 operation under normal conditions
	2.0 – 3.0 operation with high impact and with vibrations
	3.0 – 5.0 short-stroke applications < 3 × nut length

o   With alternating load and alternating speed:

F 3.9

$$F_{bm} = \sqrt[3]{F_{b1}{}^3 \times \frac{n_1}{n_m} \times \frac{t_1}{100} \times f_{p1}{}^3 + F_{b2}{}^3 \times \frac{n_2}{n_m} \times \frac{t_2}{100} \times f_{p2}{}^3 + F_{b3}{}^3 \times \frac{n_3}{n_m} \times \frac{t_3}{100} \times f_{p3}{}^3 \dots}$$

d) Axial loading on both sides:

o   Service life in revolutions

F 3.10

$$L_1 = \left(\frac{C_{dyn}}{F_{bm1}}\right)^3 \times 10^6 \qquad L_2 = \left(\frac{C_{dyn}}{F_{bm2}}\right)^3 \times 10^6$$

F 3.11

$$L = \left(L_1{}^{-10/9} + L_2{}^{-10/9}\right)^{-9/10}$$

L_1	Service life in revolutions, forward motion
L_2	Service life in revolutions, backward motion
C_{dyn}	Dynamic load rating [N]
F_{bm1}	Average operating load, forward motion
F_{bm2}	Average operating load, backward motion
L	Service life in revolutions

o   Conversion of service life into operating hours

F 3.12

$$L_h = \frac{L}{n_m \times 60}$$

L_h	Service life in operating hours
n_m	Average speed [rpm], see Formula F 3.4

o   Conversion of distance travelled [km] into operating hours:

F 3.13

$$L_h = \left(\frac{L_{km} \times 10^6}{P}\right) \times \frac{1}{n_m \times 60}$$

L_h	Service life in operating hours
L_{km}	Service life in distance travelled [km]
P	Lead [mm]
n_m	Average speed [rpm]

o   The modified service life with different reliability factors is calculated using

F 3.14

$$L_m = L \times f_r \qquad L_{hm} = L_h \times f_r$$

f_r	Reliability factor (see Table 3.17)

Table 3.17 **Reliability factor for calculating service life**	
Resilience %	**Reliability factor f_r**
90	1.00
95	0.63
96	0.53
97	0.44
98	0.33
99	0.21

3.7.3 Drive torque and drive output of motor

Fig. 3.20 shows the influencing parameters of a feed system with ballscrew.

Below you will find the formula for calculating the drive torque required of the motor:
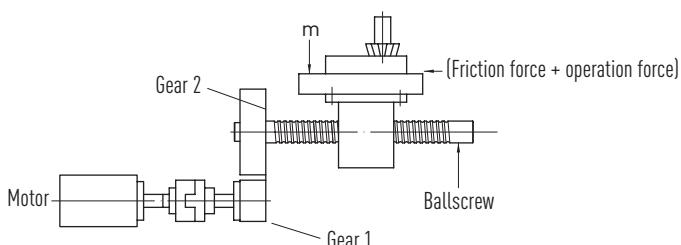

Fig. 3.20 **Load trend of a system with ballscrew**

- Normal operation (conversion of rotary motion into linear motion)

F 3.15
$$T_a = \frac{F_w \times P}{2,000 \times \pi \times \eta_1}$$

T_a Drive torque for normal operation [Nm]
T_c Drive torque for reverse operation [Nm]
F_w Effective axial load [N], friction force + operating force
P Lead [mm]
η_1 Mechanical efficiency (0.85 – 0.95), normal operation
η_2 Mechanical efficiency (0.75 – 0.85), reverse operation

- Reverse operation (conversion of linear motion into rotary motion)

F 3.16
$$T_c = \frac{F_w \times P \times \eta_2}{2,000 \times \pi}$$

- Drive torque of motor

For normal operation:

F 3.17
$$T_M = (T_a + T_b + T_d)\,\frac{N_1}{N_2}$$

T_M Motor drive torque [Nm]
T_b Friction torque of support bearing [Nm]
T_d Idle torque [Nm]
N_1 Number of teeth on driving gear wheel
N_2 Number of teeth on driven gear wheel

For acceleration:

F 3.18
$$T_a' = J \times \alpha$$

T_a' Motor drive torque during acceleration [Nm]
J Inertia torque of system [Nm²]
α Angular acceleration [rad/s²]
t_a Acceleration start-up time [s]
n_1 Initial speed [rpm]
n_2 Final speed [rpm]

F 3.19
$$\alpha = \frac{2\pi \times \Delta n}{60 \times t_a}$$

F 3.20
$$\Delta n = n_2 - n_1$$

F 3.21
$$J = J_M + J_{G1} + J_{G2} \times \left(\frac{N_1}{N_2}\right)^2 + \frac{1}{2}\,m_r \times \left(\frac{d_n}{2000}\right)^2 \times \left(\frac{N_1}{N_2}\right)^2 + m_l \times \left(\frac{P}{2000\pi}\right)^2 \times \left(\frac{N_1}{N_2}\right)^2$$

= motor inertia + equivalent gear inertia + inertia of ballscrew (see Fig. 3.20)

m_r Mass of rotating parts [kg]
m_l Mass of components moved in linear fashion [kg]
d_n Nominal diameter of ballscrew [mm]
J_M Motor inertia [kgm²]
J_{G1} Inertia of drive gear [kgm²]
J_{G2} Inertia of driven gear[kgm²]

Total drive torque:

F 3.22
$$T_{Ma} = T_M + T_a'$$

T_{Ma} Total drive torque [Nm]

Ballscrews

Properties and selection

○ Drive output

Fixed bearing – supported bearing	$f_n = 0.692$
Supported bearing – supported bearing	$f_n = 0.446$
Fixed bearing – no bearing	$f_n = 0.147$
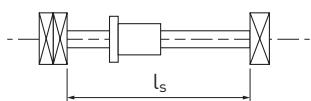

Fig. 3.21 **Definition of „Unsupported shaft length"**
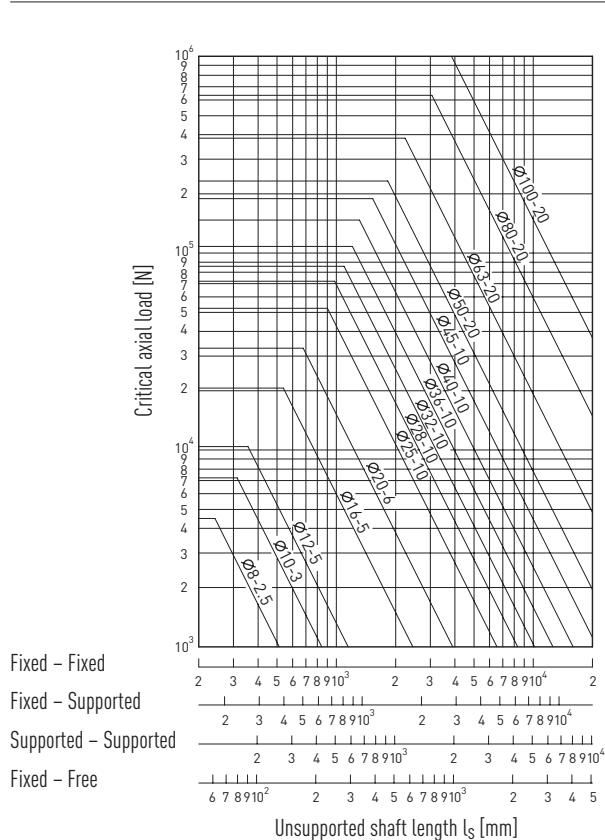

Fig. 3.22 **Buckling load for different diameters and lengths of threaded shafts**
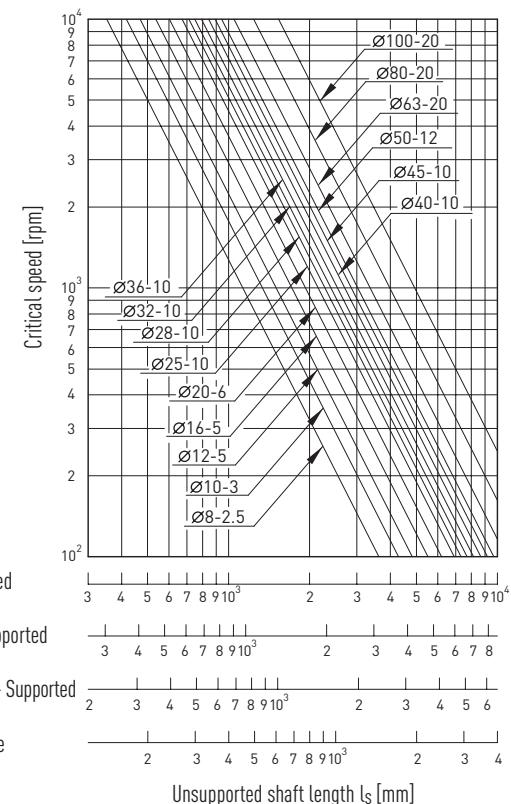

Fig. 3.23 **Critical speed for different diameters and lengths of threaded shafts**

3.7.6 D_N value for working speed of a ballscrew

The specific speed value D_N has a huge influence on the behaviour of the ballscrew in terms of noise and heat development and service life of the recirculation system.

For HIWIN ballscrews

F 3.29
$$D_N = d_s \times n_{max}$$

d_s Shaft diameter [mm]
n_{max} Max. speed [rpm]

$D_N \leq 70{,}000$ for rolled ballscrews
$D_N \leq 90{,}000$ for peeled and ground ballscrews
$D_N \leq 180{,}000$ for high-speed ballscrews

3.7.7 Rigidity

Rigidity describes the flexibility of a machine element. The overall rigidity of a ballscrew is determined by the axial rigidity of the nut/shaft system, the contact rigidity of the ball track and the rigidity of the threaded shaft. The following factors should also be taken into account when fitting the ballscrew in a machine: rigidity of support bearings, assembly conditions of nuts with table etc.
The rigidity of the nut/shaft unit and the ball and ball track can be combined to produce the rigidity of the nut Rn, which is listed in the dimensions tables for the different types of nuts.

○ Rigidity of a ballscrew

F 3.30
$$\frac{1}{R_{bs}} = \frac{1}{R_s} + \frac{1}{R_n}$$

R_{bs} Overall rigidity of a ballscrew [N/µm]
R_s Rigidity of threaded shaft [N/µm]
R_n Rigidity of nut [N/µm]

Ballscrews

Properties and selection

○ Rigidity of threaded shaft

F 3.31
$$R_{s1} = \frac{\pi \times d_c^2 \times E}{4 \times l_1 \times 10^3}$$

fixed – floating/unsupported

F 3.32
$$R_{s2} = \frac{\pi \times d_c^2 \times E}{4 \times l_1 \times 10^3} \times \frac{l_2}{l_2 - l_1}$$

fixed – fixed

F 3.33
$$d_c = PCD - D_k \times \cos \alpha$$

R_s Rigidity of threaded shaft [N/µm]
d_c Diameter on which the force acts on the ballscrew shaft
E Elasticity module [N/mm²]
α Contact angle between ball and track [°]
PCD Ball centre diameter of circle [mm]
D_k Nominal diameter of ball [mm]
l_1 Distance between bearing and nut [mm]
l_2 Distance between bearing and bearing [mm]

○ Rigidity of nut

The nut rigidity can be checked using an axial force corresponding to the maximum possible preload of 10 % of the dynamic load rating (C_{dyn}) (this is listed in the dimensions tables for the nuts). With a lower preload, the nut rigidity can be determined by extrapolation:

F 3.34
$$R_n = 0.8 \times R \times \left(\frac{F_{pr}}{0.1 \times C_{dyn}} \right)^{1/3}$$

R_n Rigidity of nut [N/µm]
R Rigidity in accordance with dimensions table [N/µm]
F_{pr} Preload [N]
C_{dyn} Dynamic load rating from dimensions table [N]

The rigidity of a single nut with play can be calculated as follows with an external axial load of 0.28 C_{dyn}:

F 3.35
$$R_n = 0.8 \times K \times \left(\frac{F_{bm}}{0.28 \times C_{dyn}} \right)^{1/3}$$

The axial rigidity of a feed system includes that of the support bearing and assembly table. The total rigidity should be noted with care when configuring the system.

Fixed – Fixed

Fixed – Supported

R_n Rigidity of ballscrew nut
R_{nb} Rigidity of balls and ball track
R_{nr} Rigidity of nut/shaft system with radial load

Fig. 3.25 **Rigidity factors for feed systems with ballscrews**

3.7.8 Thermal expansion

An increase in temperature in ballscrew shafts during operation impacts on the accuracy of a machine's feed system, since the threaded shaft extends through the thermal stress.

The following factors affect the temperature increase in ballscrews:

1) Preload
2) Lubrication
3) Stretching of the shaft

Fig. 3.26 shows the relationship between operating speed, preload and temperature increase. Fig. 3.27 shows the temperature increase in the nut depending on idle torque.

Ballscrew data:
R40-10-B2-FDW

△ = 1,500 rpm with 2,000 N preload
× = 1,500 rpm with 1,000 N preload
□ = 500 rpm with 2,000 N preload
○ = 500 rpm with 1,000 N preload

Lead	10
Ball diameter	6.35
Circuits	2.5 × 2
Speed	2,000 U/min
Running time	1.5 sec
Stop time	1 sec
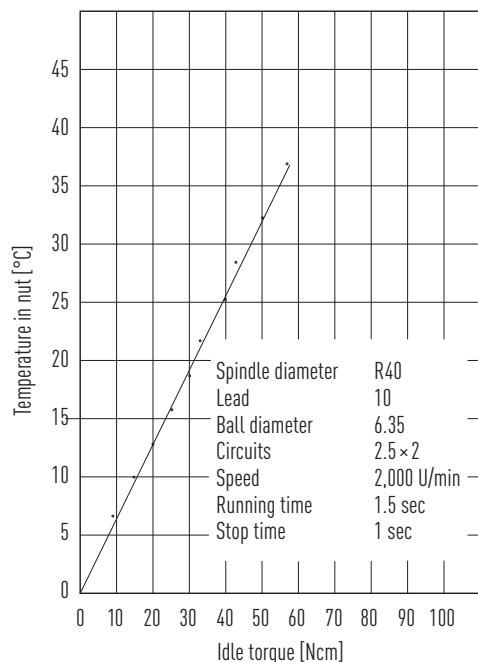

Fig. 3.27 **Relationship between temperature increase in the ballscrew and idle torque**

The thermal expansion of the threaded shaft can be determined using formula F 3.36. The expansion can be compensated by stretching of the shaft. For further information please consult HIWIN.

F 3.36

$$\Delta L = 11.6 \times 10^{-6} \times \Delta T \times l_{s;total}$$

ΔL Thermal expansion of threaded shaft [mm]
ΔT Temperature increase in threaded shaft [°C]
$l_{s;total}$ Shaft length + shaft end (left/right) [mm]

3.8 Material and heat treatment

3.8.1 Materials of the components

Table 3.18 **Material overview**

| Components | Material numbers according to DIN EN 10027 | | |
	Rolled ballscrews	Peeled ballscrews	Ground ballscrews
Shaft	1.1213	1.1213 1.7225	1.7228
Nut [1]	1.6523 [1]		
Ball	1.3505		

[1] Special nuts 16MnCr5B

3.8.2 Heat treatment

Table 3.19 shows the hardness of the main components used in HIWIN ballscrews. The surface hardness of the ballscrew affects both the dynamic and the static load rating. The dynamic and static load ratings listed in the dimensions tables are based on a surface hardness equivalent to HRC 60. For surface hardnesses of less than this, the load ratings can be determined using the following calculation.

F 3.37

$$C_0' = C_0 \times f_{H0} \qquad f_{H0} = \left(\frac{\text{real hardness (HRC)}}{60} \right)^3 \leq 1$$

With hardness levels f_H and f_{H0}
C_0' Corrected static load rating
C_0 Static load rating at 60 HRC

F 3.38

$$C' = C_{dyn} \times f_H \qquad f_H = \left(\frac{\text{real hardness (HRC)}}{60} \right)^2 \leq 1$$

C' Corrected dynamic load rating
C_{dyn} Dynamic load rating at 60 HRC

Table 3.19 **Härtegrade der für HIWIN-Kugelgewindetriebe verwendeten Komponenten**

Components	Hardening method	Hardness (HRC)
Shaft	Carburizing	58 – 62
Nut	Carburizing or induction hardening	58 – 62
Ball		62 – 66

3.9 Lubrication

HIWIN ballscrews can be lubricated with grease, semi-fluid grease or oil depending on the application. They are supplied preserved as standard and must never be taken into service without initial lubrication. For information about the initial greasing, amounts of lubricant and lubrication intervals, please consult the assembly instructions "Ballscrews".

Table 3.20 **Information about checking and topping up lubricant**

Lubrication method	Information about checking
Oil	Check oil level once a week and check oil for contamination If contaminated, we recommend changing the oil
Grease	Check grease for contamination every two to three months If contaminated, replace old grease with new grease Always replace grease on an annual basis

4. Rolled ballscrews

4.1 Properties

One of the benefits of rolled ballscrews is that feed systems equipped with them have less friction and are quieter than standard threads.
HIWIN manufactures them using state-of-the-art rolling technologies where the processes of material selection, rolling, heat treatment, machining and assembly are very closely coordinated.

Rolled ballscrews from HIWIN can be flexibly used in virtually all areas of industry. Rolled ballscrew shafts with diameters of 8 mm to 63 mm are always kept in stock and can be supplied at short notice. They can be supplied with or without end machining. Complete bearing units combined with standardised shaft ends enable us to supply complete ballscrews.

4.2 Tolerance classes

Table 4.1 shows the tolerance classes of rolled ballscrews. The lead accuracy is defined using the deviation from nominal path over any 300 mm section of the entire length. The path deviation over the entire useful path is determined by formula F 3.1 on Page 16.

Table 4.1 **Tolerance classes of rolled ballscrews**

Path deviation	Tolerance class		
	T5	T7	T10
v_{300p}	0.023	0.052	0.21

Unit: mm

Table 4.2 **Overview of available rolled ballscrews**

Nominal diameter	Lead																		Max. shaft length	
	1	1.25	2	2.5	3	4	5	5.08	6	8	10	12	16	20	25	32	40	50	T5	T7, T10
8	○		○	○×	○		○												—	800

5. Peeled ballscrews

5.1 Properties

In terms of quality, peeled ballscrews from HIWIN fall between rolled and ground ballscrews and can therefore be used for numerous transport or positioning applications. On request, we are happy to produce a lead measurement report for them. A number of nut shapes are available for peeled ballscrews, as both single and double nuts. Customised complete ballscrews can be produced with short lead times. Complete bearing units combined with standardised shaft ends minimise the amount of design work involved.

5.2 Tolerance classes

Table 5.1 shows the tolerance classes of peeled ballscrews. The lead accuracy is defined using the deviation from nominal path over any 300 mm section of the entire length.

Table 5.1 **Tolerance classes of peeled ballscrews**		
Path deviation	Tolerance class	
	T5	T7
v_{300p}	0.023	0.052

Unit: mm

Table 5.2 **Overview of available peeled ballscrews**					
Nominal diameter	Lead			Max. shaft length [1]	Max. thread length
	5	10	20		
16	○✕			3,700	3,300
20	○✕			6,300	5,500
25	○✕	○✕		6,300	5,500
32	○✕	○✕	○✕	6,500	5,500
40	○✕	○✕	○✕	6,500	5,500
50	○✕	○✕	○✕	6,500	5,500
63		○✕	○✕	6,500	5,500
80		○✕	○✕	6,500	5,500

Unit: mm

○   Right-hand and left-hand thread
✕   Preferred type for right-hand thread with fast delivery

[1] The critical speed and max. buckling force should be taken into account for long shafts.

## 5.3 HIWIN order code for peeled ballscrews

In order to clearly identify the ballscrew, information about the ballscrew shaft and nut is needed..

5.4.6 Safety nut SEM

The safety nut comprises a ball thread unit and safety unit. The safety nut basically works like a normal ballscrew nut. If the axial play is increased due to wear, ball failure or ball loss, the thread of the safety unit comes into contact with the ball thread. The nut cannot therefore break out. The normal function of the unit is guaranteed up to an axial play of 0.4 mm.

Areas of application:
- Lifting equipment
- Clamping fixtures
- Lifting platforms
- Elevators

All dimensions stated without a unit are in mm

Note:
Simply using a safety nut does not provide sufficient protection against a load being lowered unintentionally. The safety guidelines valid for the application must be observed. The safety nut it is not a safety component according to the Machinery Directive.

6. Ground ballscrews

6.1 Properties

Of the various production methods used for ballscrews, ground ballscrews offer the greatest accuracy. Ballscrews with a lead accuracy of up to 3.5 µm/300 mm thread length can be produced by grinding after hardening. They are used mainly in machine tools, grinding machines and measuring machines.

Ground ballscrews are always customized, enabling the customer's requirements relating to nut shape, load ratings, preload method, wiper type and end machining to be met. Contact our team for more details.

Below you will find typical standardized nut shapes, nominal diameters and leads. This is just part of our range. We can provide other nut dimensions on request.

6.2 Tolerance classes

(tolerance class)

Total length

Thread length

Nut shape/nut type
(see Table 6.3)

Ball filling of nut:
None: Single thread filled
D: Double thread filled
T: Triple thread filled
Q: Four thread filled
O: Pre-loaded by lead offset in the nut

Number of recirculations

Order code for ballscrew shaft without the nut

| 1 | R | 40 | 10 | 800 | 1000 | 0.052 |

Number of thread turns on shaft:
1: Single thread [1]
2: Double thread
3: Triple thread
4: Fourfold thread

Thread direction:
R: Right-hand thread
L: Left-hand thread

Nominal diameter

Lead deviation across 300 mm
(tolerance class)

Total length

Thread length

Lead

Order code for ballscrew nut without the shaft

| R | 40 | 10 | K | 3 | | FSCDIN |

Thread direction:
R: Right-hand thread
L: Left-hand thread

Nominal diameter

lead

Type of recirculation:
K: Cassette recirculation
T: Internal recirculation
B: External recirculation

Nut shape/nut type
(see Table 6.3)

Ball filling of nut:
None: Single thread filled
D: Double thread filled
T: Triple thread filled
Q: Four thread filled
O: Pre-loaded by lead offset in the nut

Number of recirculations

---

[1] Standard; can be omitted with single-thread shafts

Table 6.3 **Overview of nut shapes**

Nut designation	Description
FSC	Flange single nut with cassette recirculation
FDC	Flange double nut with cassette recirculation
FSI	Flange single nut with internal single recirculation
FDI	Flange double nut with internal single recirculation
RSI	Cylindrical single nut with internal single recirculation
RDI	Cylindrical double nut with internal single recirculation

6.4 Nuts for ground ballscrews

6.4.1 DIN single nut FSC (DIN 69051 Part 5) with total recirculation

Hole pattern 1
ds ≤ 32
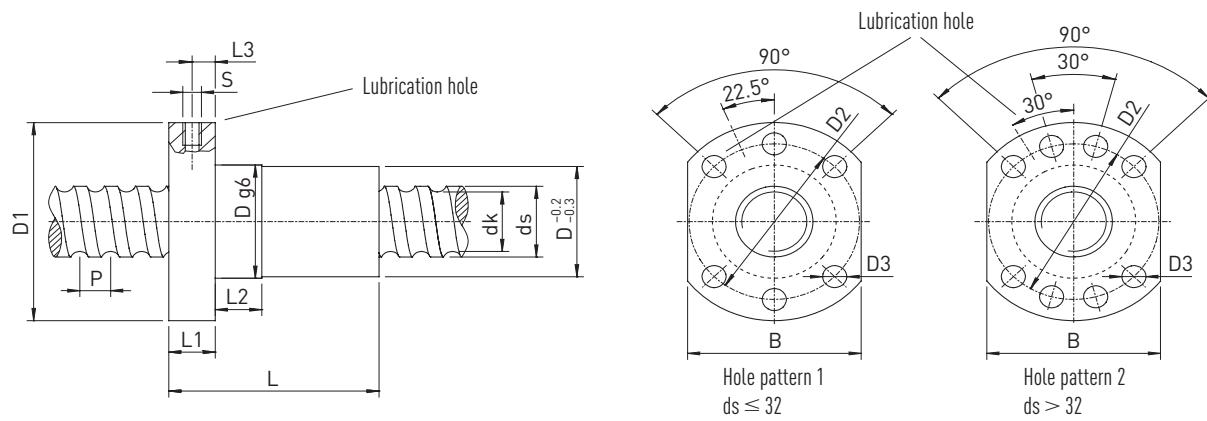

Hole pattern 2
ds > 32

All dimensions stated without a unit are in mm
[1] Non-standard series of DIN 69051 Part 5 for high leads or of nut diameters deviating from the DIN standard

- The rigidity values stated are determined by calculation without preload for loading of 30 % of the dynamic load rating
- Deviating nut dimensions on request
- Other diameters and leads on request
- Left-handed nuts on request

Order example:

R	40	40	K2	FSC	1200	1295	0.012

6.4.2 DIN double nut FDC (DIN 69051 Part 5) with total recirculation

All dimensions stated without a unit are in mm

[1] Non-standard series of DIN 69051 Part 5 for high leads or of nut diameters deviating from the DIN standard

- The rigidity values stated are determined by calculation for a preload of 10 % of the dynamic load rating
- Deviating nut dimensions on request
- Other diameters and leads on request
- Left-handed nuts on request

Order example:

R	40	40	K2	FDC	1200	1295	0.012

6.4.3 Flange single nut FSI with single recirculation

7.2 Ballscrews for heavy-duty operation

7.2.1 Areas of application

Ballscrews for heavy-duty operation are used in applications such as in injection moulding machines, die casting machines, presses, driving mechanisms and robots.

7.2.2 Performance features

Can withstand high loads
- Load capacities 2–3 times greater than standard versions
- High load rating for axial loads, good acceleration
- Short travel distance thanks to special design for lubrication

Accuracy
- T5 and T7

High rapid motion speeds and long service life
- Reinforced ball recirculation systems for use at high speeds and with long service lives

Maximum length: 2 m

8. Shaft ends and accessories

8.1 Shaft ends and bearing configuration

To reduce the amount of design work required, we provide standardised end machining processes and bearing units. We recommend the "B", "E" and "F" bearing series for simple transport applications and low axial forces. The SFA and SLA bearing units are suited to more challenging precision applications. The WBK series is available for heavy-duty applications.

When selecting the suitable bearing type, the permissible axial force of the fixed bearing must also be taken into account.

Table 8.1 **Overview of standard shaft ends for SFA, SLA bearing series**
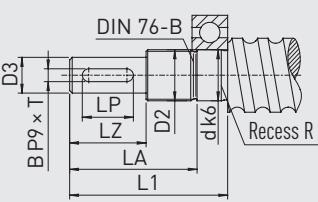

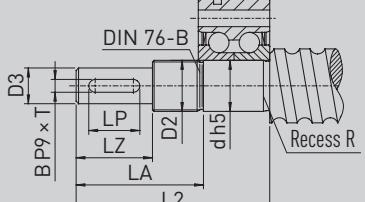

Supported bearing type S1
Bearing: deep groove ball bearing 60.. or 62..
For SLA bearing unit

Fixed bearing type S2
Bearing: ZKLF.. or ZKLN..

Ballscrews

Accessories

8.2 WBK bearing series

series are especially suited to use in heavy-duty ballscrews. Depending on the axial loads present, the WBK bearing units are available with the DF, DFD and DFF bearing arrangements.

The end machining processes suited to the WBK fixed bearing are types W1, W2 and W3 (Section 8.1).

8.3 SFA/SLA bearing series

8.3.1 Fixed bearing SFA

The axis height of the fixed bearing is matched to supported bearing SLA (Section 8.3.2) and nut housing GFD (Section 8.4). The pillow block can be screwed on from above (S1) and below (S2).
The reference edge makes it easier to align the unit. The fixed bearing can be pinned with two tapered pins or cylindrical pins. The end machining suited to the fixed bearing is the S2-xx/S3-xx type (Section 8.1).

8.4 Housing for flange nuts (DIN 69051 Part 5)

The nut housing is suitable for assembling flange nuts DEB, DDB and FSCDIN. The axis height of the housing is matched to fixed bearing SFA (Section 8.3.1) and the supported bearing SLA (Section 8.3.2).

The housing can be screwed on from above (S1) and below (S2). The housing can be pinned with two tapered pins or cylindrical pins. Screws of strength class 8.8 should be used for the fastening.

The ball cages are made from plastic, permissible operating temperature 120 °C (continuous operation)

[1] Tightening torque of mounting bolts according to details from manufacturer.
   Screws according to DIN 912 are not supplied

[2] Bearing friction torque with gap seal (.2Z). With contact seal (.2RS) ≈ 2 × M_{RL}

8.8.3 Angular contact ball bearing ZKLN

- Angular contact ball bearing with 60° contact angle
- Split inner ring with defined gap for matching of preload
- High limiting speeds, even with grease lubrication
- Lubricated for life for most applications
- Lubrication groove and three lubrication holes at the outside surface of the outer ring

Acting on two sides
Series ZKLN...2RS, ZKLN...2Z
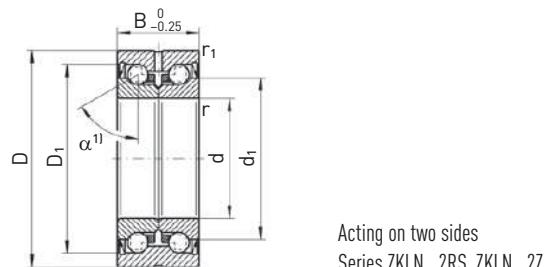

**Housing and shaft tolerances ZKLN...2RS/...2Z**
